

1 **ABSTRACT**
2

3 A system is presented including a plurality of sources, and an interface,
4 selectively coupled to the plurality of sources, to generate and implement a
5 development project of processing chains, wherein the interface dynamically loads
6 a processing chain for each of the plurality of media sources at a point during the
7 execution of the project when the chain is required, and wherein the interface is
8 configured to unload at least a subset of the chains when they are not required.
